

Garden Care

Where GitHub and Netlify keep the project

The site you use on your phone is built from GitHub and runs on Netlify. The tasks themselves are not in the code: they are in the Netlify database.

GitHub

Repository: [psytek78/Alma-Verde-garden-care](#)

Where	What it holds
Branch main	The published code. Netlify publishes this branch.
Branch feature/inspection-sheet-sync	The old attempt to sync the Google Sheet. This is not the site in use.
app/	The phone interface: Today, Tasks, Team, More, and the task screen.
app/api/inspections/	Reading and saving tasks.
netlify/database/migrations/	Database schema changes, applied on deploy.
netlify/functions/	Uploading and reading photos.
skills/new-task/SKILL.md	Instructions so a chat can create a task. It is not a page on the site.

The repository does not contain the tasks, the photos, or the passwords.

Netlify

Project: [almaiso-garden-care](#)

Site: [almaiso-garden-care.netlify.app](#)

Where	What it holds
Published site	The app built from main. Every push to main starts a new deploy.
Netlify Database	The only copy of the tasks: date, problem, cause, solution, assignee, status, notes, and photo link.
Netlify Blobs	The photo files. The database stores only the link.
Environment variables	The keys. They stay here, not in the repository.

The production deploy today is the commit that fixed saving the assignee.

What is no longer part of this flow

The Google Inspection sheet no longer updates the app. The old ChatGPT site, [almaiso-garden-care.psytek332073.chatgpt.site](#), is a separate publication: it is not this repository and not this Netlify project.
